

Gas Dynamics and Star Formation in Low-Mass Galaxies

Federico Lelli (ESO Fellow - Garching)

Strasbourg Observatoire, 12 May 2017

Outline

- Overview on Dwarf Galaxies

Structure, dynamics, and evolution

- Starburst Dwarf Galaxies

Understanding stellar feedback and galaxy evolution

- Tidal Dwarf Galaxies

A new channel to form low-mass galaxies at $z=0$?

Overview on Dwarf Galaxies

Central Stellar Density

Binggeli (1994)

Total Stellar Mass

Central Stellar Density

Total Stellar Mass

Tolstoy et al. (2009)

Central Stellar Density

Total Stellar Mass

Tolstoy et al. (2009)

Spheroidals

NGC 205

- Gas poor. No SF.
- Close to spirals or in galaxy cluster

Other names:

dE, Early-Type Dwarfs

Irregulars

WLM

- Gas rich. Low SF.
- Isolated, groups, or outskirts of clusters

Other names:

Im, Sm, Late-Type Dwarfs

Starburst dwarfs

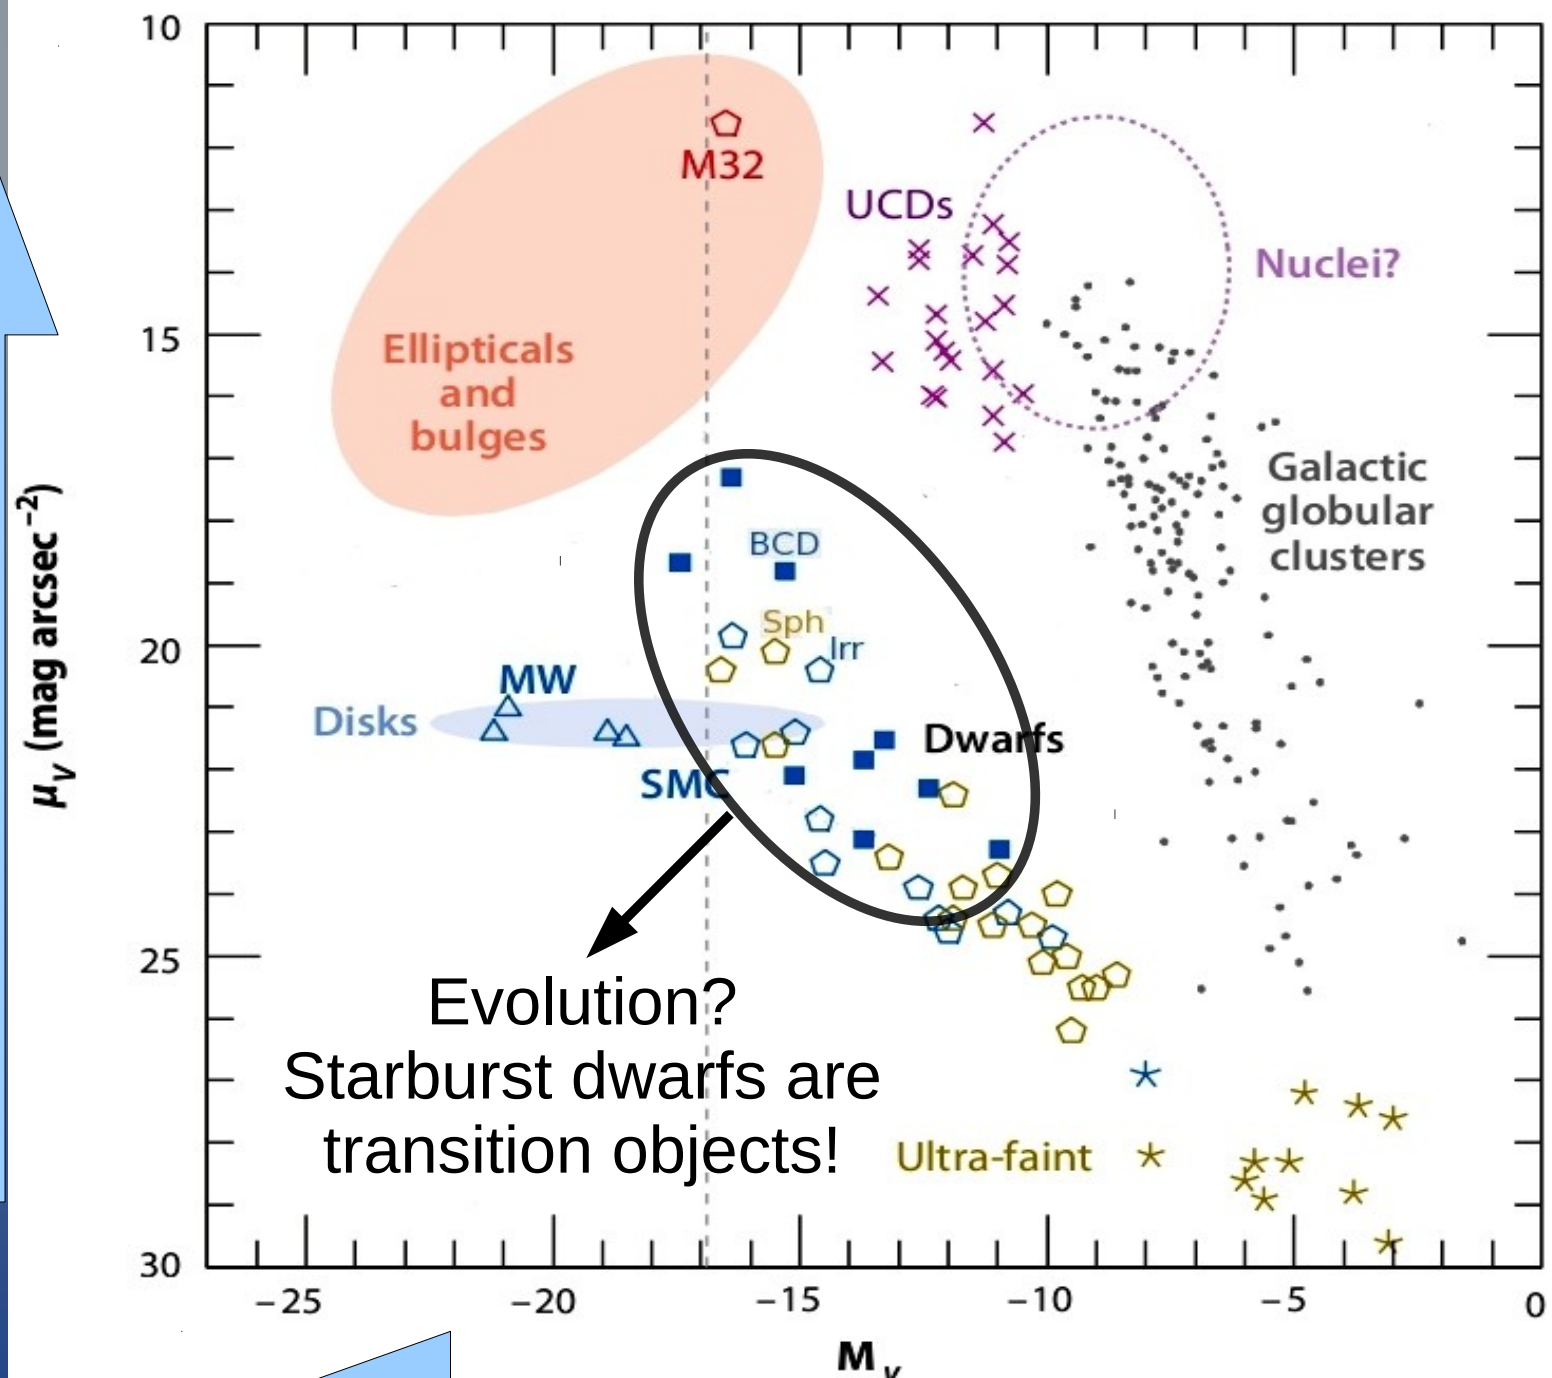

I Zw 18

- Gas rich. Burst of SF.
- Isolated, groups, or outskirts of clusters

Other names:

BCDs, H_{II} gals, Amorphous

Central Stellar Density

Total Stellar Mass

Tolstoy et al. (2009)

Evolution of Dwarf Galaxies

Gas-rich dwarf

I Zw 18

Internal Processes

- Feedback & Outflows?
- SF and Starvation?

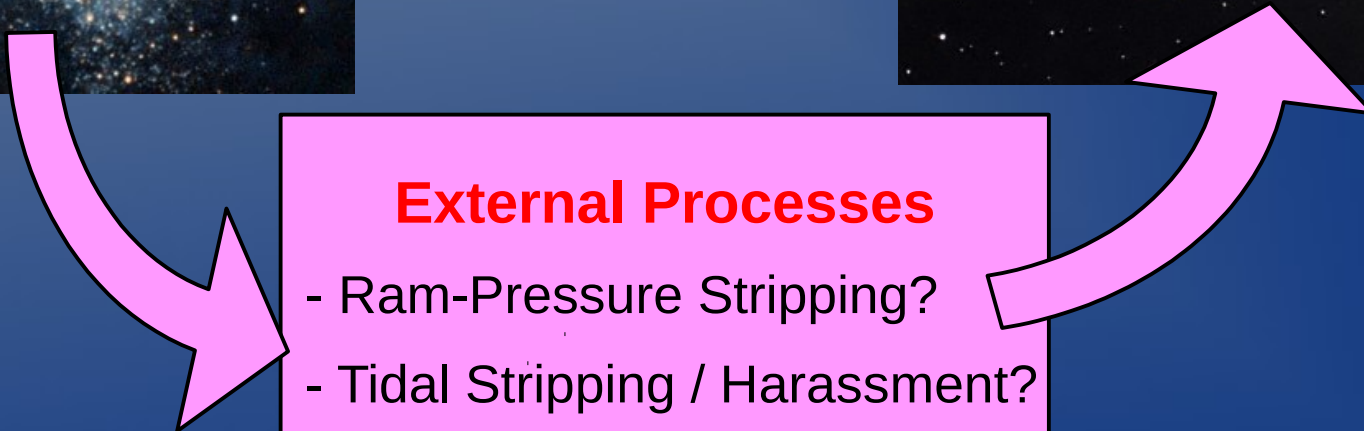

Gas-poor dwarf

NGC 205

External Processes

- Ram-Pressure Stripping?
- Tidal Stripping / Harassment?

Evolution of Dwarf Galaxies

Gas-rich dwarf

Gas-poor dwarf

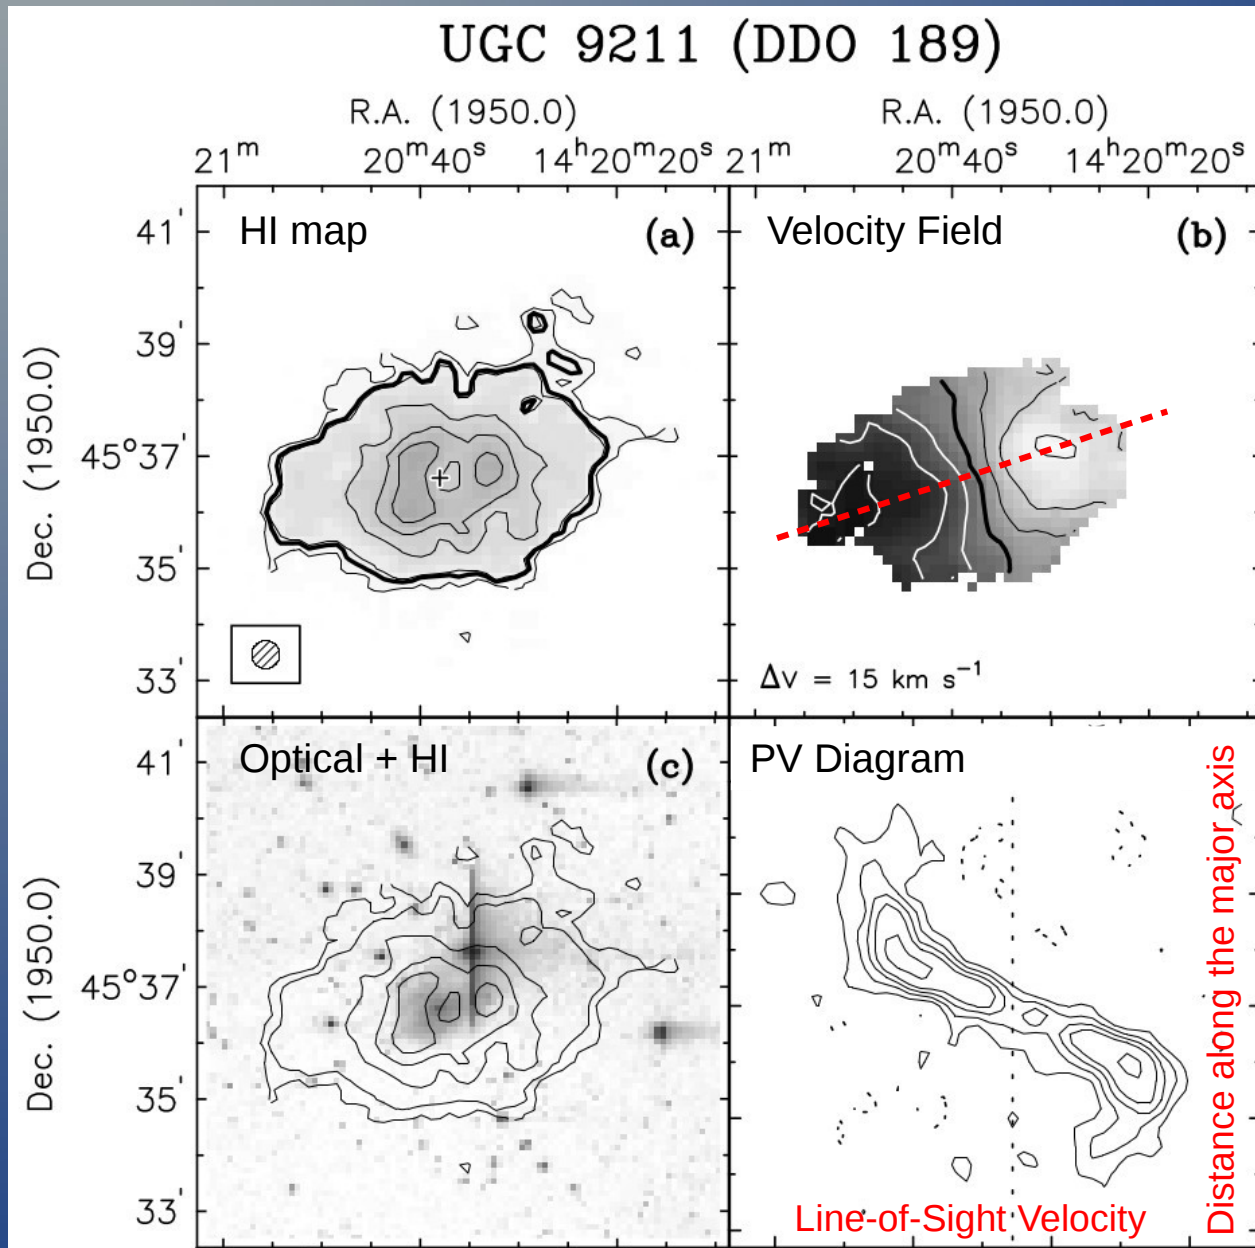

Internal Processes
NOT AN OPTION!!!

External Processes

- Gas Accretion from the IGM?
- Merger with gas-rich dwarf?

Dwarf Irregulars are very regular in HI!

Swaters+(1999, 2002)

- 73 late-type dwarfs
from WHISP survey:
- 90% have regularly rotating HI disks
 - 10% are mergers or poorly resolved disks

Starburst Dwarfs

In collaboration with:

Marc Verheijen, Filippo Fraternali, Renzo Sancisi,
Kristen McQuinn, Evan Skillman, Anna McLoed, Giacomo Beccari

Why do we care about starbursts?

Stellar feedback is needed to solve several problems in LCDM:

- galaxy stellar mass function (e.g. Kauffmann+1993, Vogelsberger+2013)
- bulgeless & superthin galaxies (e.g. Governato+2010, Brook+2011)
- cusp-core problem (e.g. Navarro+1996, Oh+2011, Governato+2012)

Galaxy Stellar-Mass Function

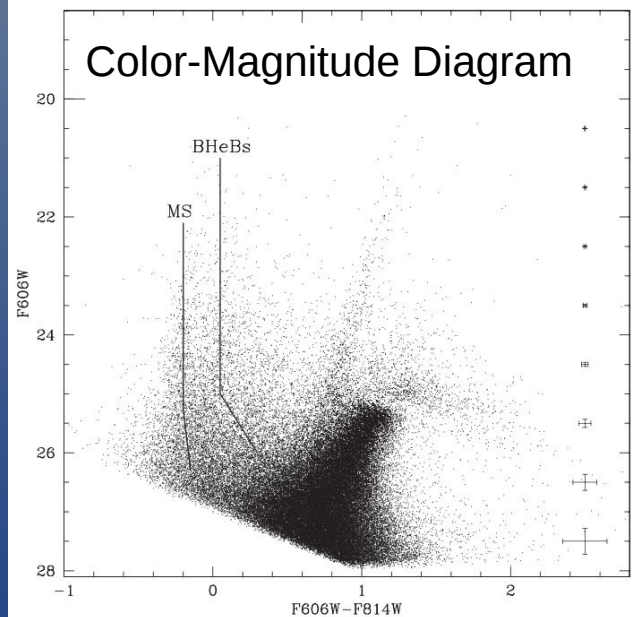

Simulated Dwarf Galaxy

DM density profile

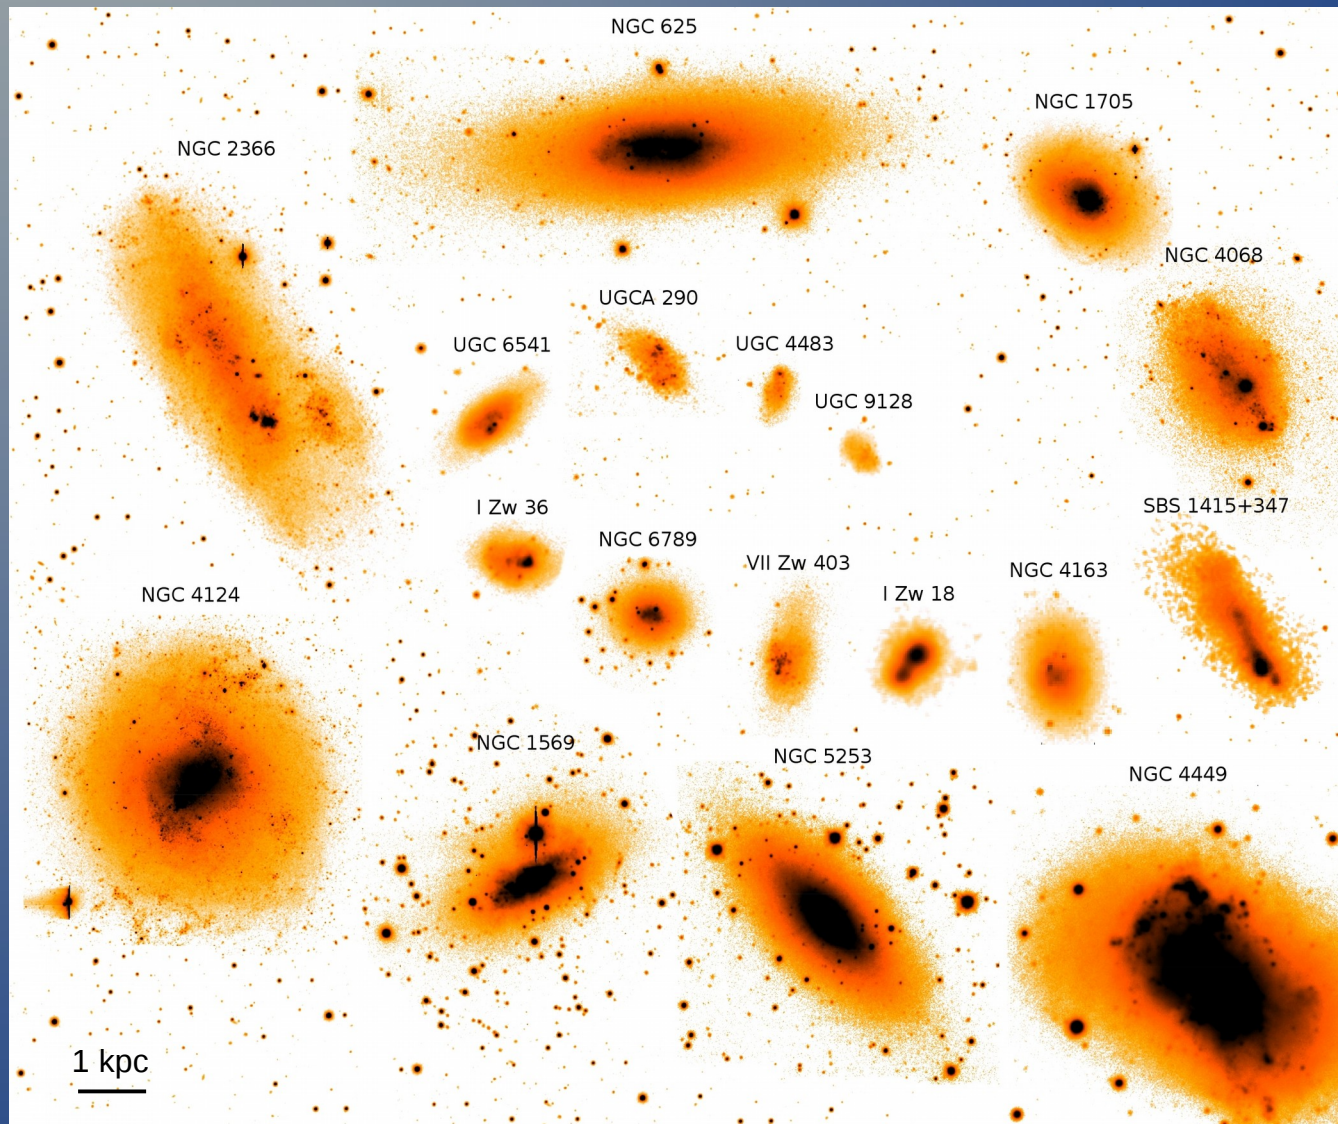

Stellar populations in Starburst Dwarfs

- Birthrate = $\text{SFR}(t_{\text{peak}}) / \overline{\text{SFR}} \geq 3$
- Starburst durations (few 100 Myr)
- Energies from SN & stellar winds

Sample of 18 Starburst Dwarfs

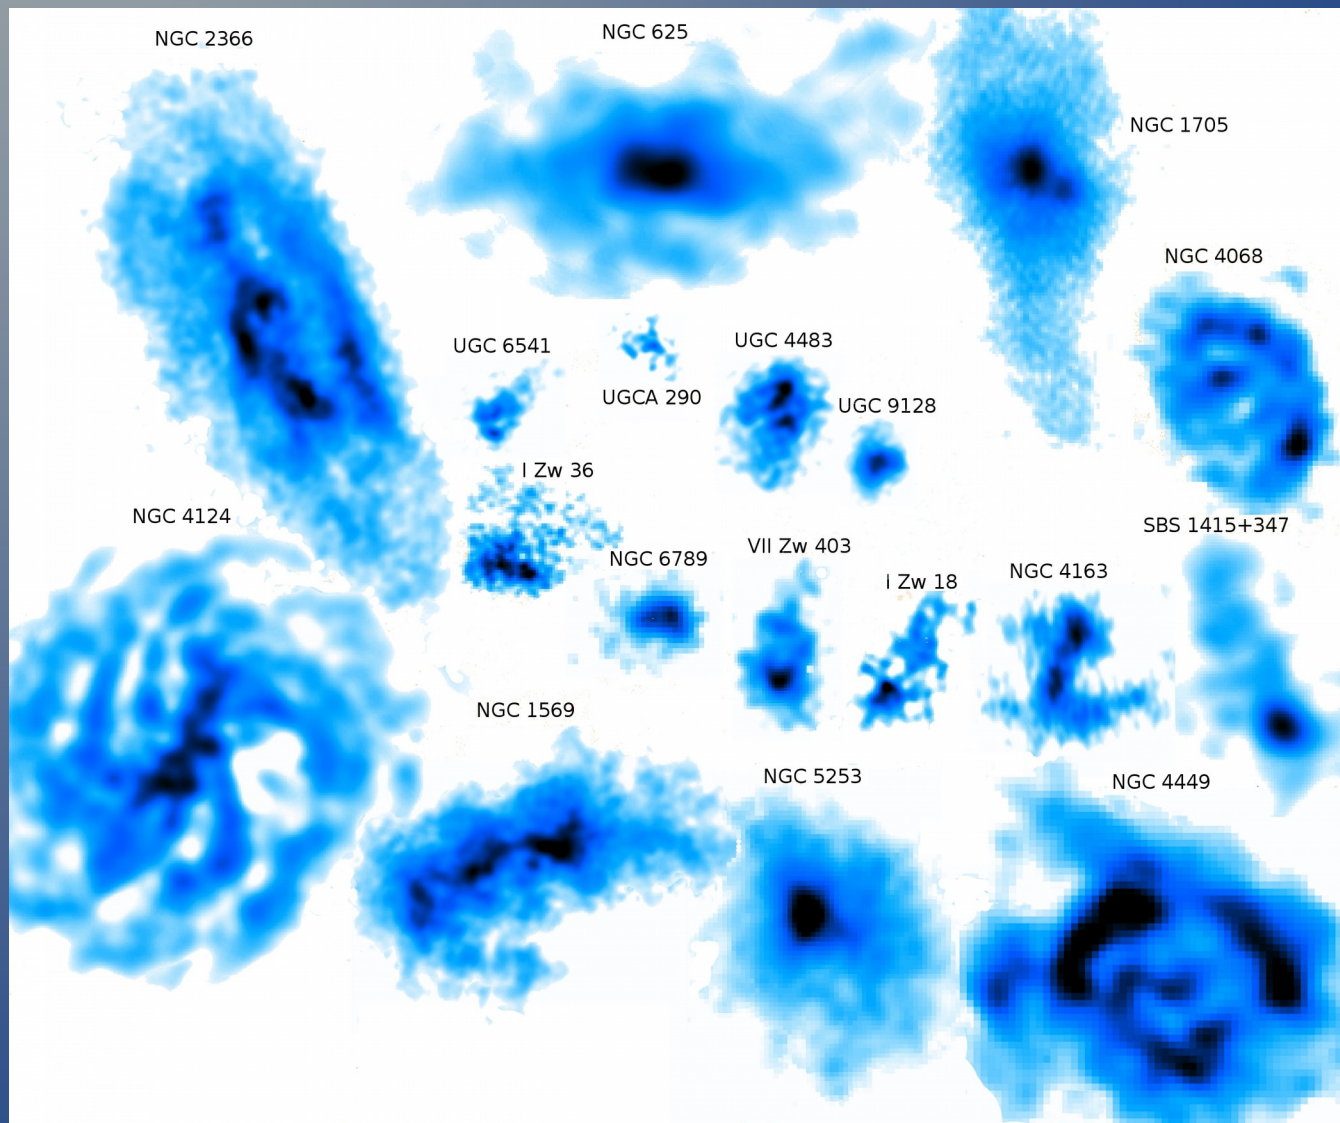

Resolved into single stars by HST obs:

- Distance (< 5 Mpc)
- Star Formation History
- $b = \text{SFR}(t_{\text{peak}})/\overline{\text{SFR}} \geq 3$

Lelli, Verheijen & Fraternali (2014)

$$M_* \sim 10^7 - 10^9 M_{\odot} \quad R_{\text{opt}} \sim 0.5 - 5 \text{ kpc}$$

Sample of 18 Starburst Dwarfs

Resolved into single stars by HST obs:

- Distance (< 5 Mpc)
- Star Formation History
- $b = \text{SFR}(t_{\text{peak}})/\overline{\text{SFR}} \geq 3$

21-cm line obs (VLA, WSRT, ATCA):

- HI distribution
- HI kinematics

Lelli, Verheijen & Fraternali (2014)

$$M_* \sim 10^7 - 10^9 M_{\odot} \quad R_{\text{opt}} \sim 0.5 - 5 \text{ kpc}$$

Questions:

- What triggers the starburst?
(External vs Internal mechanisms)
- What is the effect of stellar feedback?
(Gas outflows? Shocks?)
- What are the progenitors/descendants?
(Evolutionary links with Irrs and Sphs?)

Questions:

- What triggers the starburst?
(External vs Internal mechanisms)
- What is the effect of stellar feedback?
(Gas outflows? Shocks?)
- What are the progenitors/descendants?
(Evolutionary links with Irrs and Sphs?)

Large-scale HI distribution

Irregular: Sextans B

1 kpc

VLA-ANGST (Ott+2012)

Lowest HI contour = $5 \times 10^{19} \text{ cm}^{-2}$

Large-scale HI distribution

Irregular: Sextans B

1 kpc

VLA-ANGST (Ott+2012)

Starburst: I Zw 18

1 kpc

Van Zee+1998; Lelli+2012a

Lowest HI contour = $5 \times 10^{19} \text{ cm}^{-2}$

Quantifying the outer HI Asymmetry

Original image $I(i, j)$

Rotated Image $I_{180}(i, j)$

Standard A parameter

(e.g. Bershadsky 2000, Holwerda+2011)

$$\mathcal{A} = \frac{\sum_{i,j} |I(i, j) - I_{180^\circ}(i, j)|}{\sum_{i,j} |I(i, j)|}$$

Our A parameter (Lelli+2014, MNRAS)

$$A = \frac{1}{N} \sum_{i,j}^N \frac{|I(i, j) - I_{180^\circ}(i, j)|}{|I(i, j) + I_{180^\circ}(i, j)|}$$

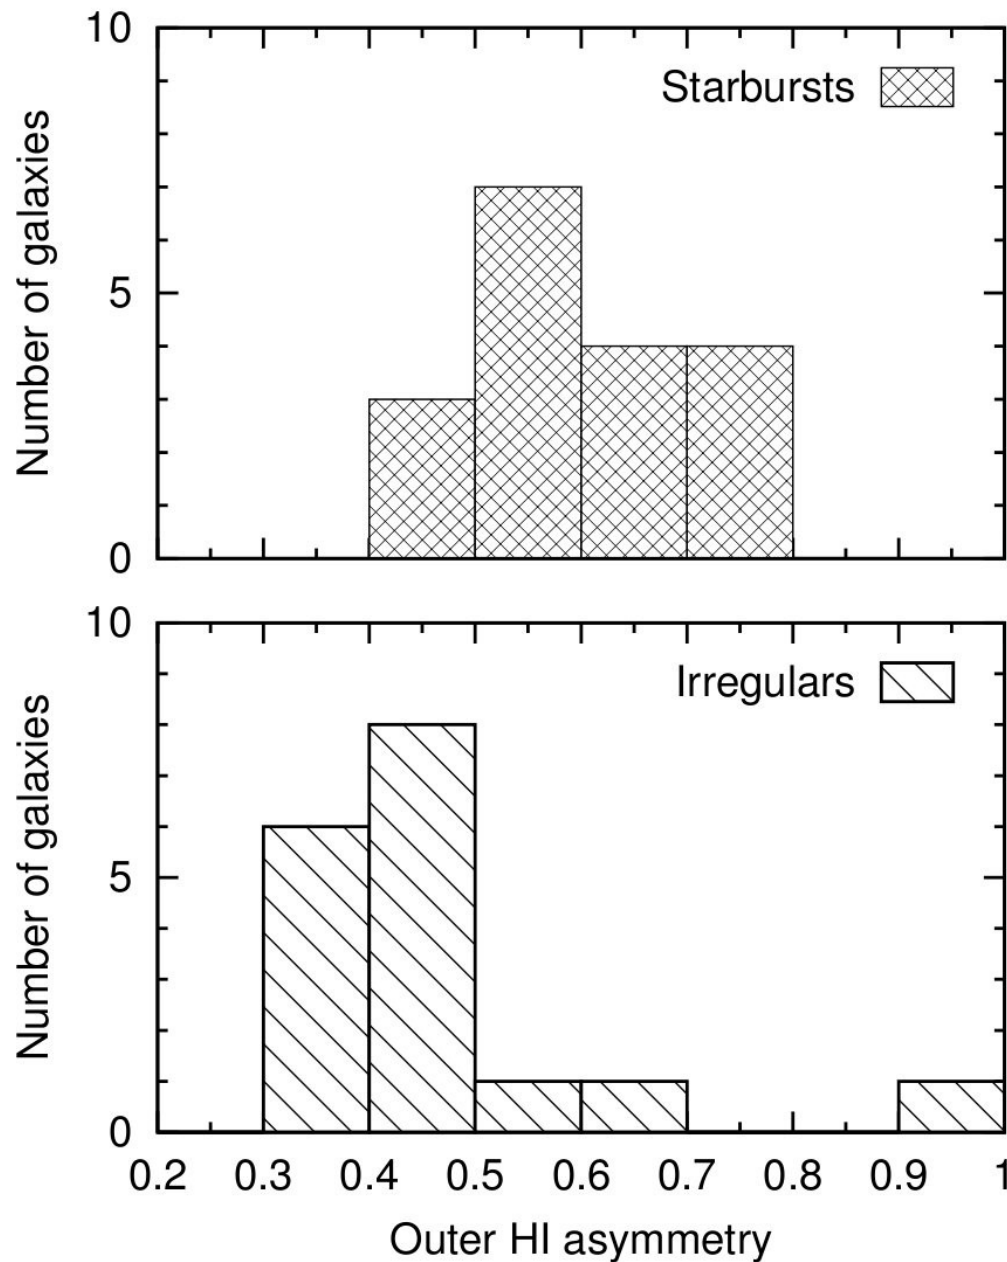

Good for **outer regions**!

For all galaxies:

- Uniform column density sensitivity
- Similar linear resolution (in kpc)

HI Asymmetry: Starbursts vs Irrs

Starbursts have more asymmetric outer HI distributions than Irrs

Irrs from VLA-ANGST (Ott et al. 2012)

HI Asymmetry: Starbursts vs Irrs

Starbursts have more asymmetric outer HI distributions than Irrs

External mechanisms triggered the starburst:

- Interactions/mergers?
- Cold gas accretion?

See also: Ekta & Chengalur (2010); Lopez-Sanchez et al. (2010).

Irrs from VLA-ANGST (Ott et al. 2012)

HI Asymmetry vs Starburst "Age"

Star-Formation History:

FOR OLD BURSTS:

$t_p \sim t_{\text{orb}}$ in outer parts. HI distribution can be regularized by rotation!

Questions:

- What triggers the starburst?
(External vs Internal mechanisms)
- What is the effect of stellar feedback?
(Gas outflows? Shocks?)
- What are the progenitors/descendants?
(Evolutionary links with Irrs and Sphs?)

Internal HI Kinematics of Starbursts

~50%
rotating HI disk

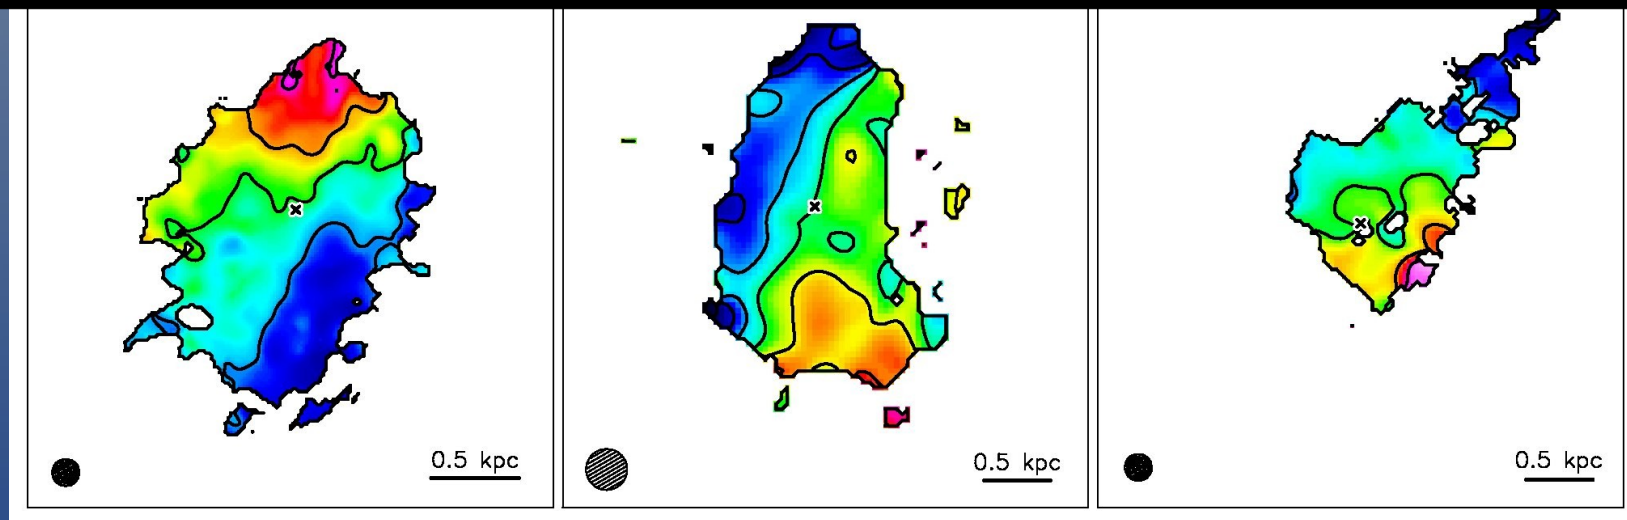

~40%
kin. disturbed HI disk

~10%
unsettled HI distr.

Internal HI Kinematics of Starbursts

Starburst Dwarf Galaxies do NOT explode!

~50%
rotating HI disk

~40%
kin. disturbed HI disk

~10%
unsettled HI distr.

Gas Fractions: Starbursts vs Irrs

$$F_{\text{gas}} = M_{\text{HI}} / M_{\text{dyn}} \text{ within } R_{\text{opt}} \quad (\text{Irrs from Swaters+2009})$$

Similar f_{gas} as typical Irrs:

- No evidence for massive outflow
- $t_{\text{dep}} = M_{\text{HI}} / \text{SFR} = 2\text{-}10 \text{ Gyrs}$ (up to 20 Gyr for Irrs)

Star-Formation History

Gas Outflows in H α and X rays

- Velocity of the **ionized gas** does not exceed V_{esc}

(Martin 1996, 1998; Schwartz & Martin 2004; van Eymeren+2009, 2010)

- Mass of the **hot gas** $\sim 1\%$ M_{HI} (e.g. Ott+2005)

NGC 1705: a case-study with MUSE

McLeod, Lelli & Beccari (in prep.)

NGC 1705: a case-study with MUSE

H α map from MUSE

Similar maps for H β , HeI, [NII],
[OI], [OII], [OIII], [SII], [SIII], [ArIII]

McLeod, Lelli & Beccari (in prep.)

NGC 1705: BPT diagrams from MUSE

No evidence for shocks. Young stars do the job!

Are these radiation fronts?

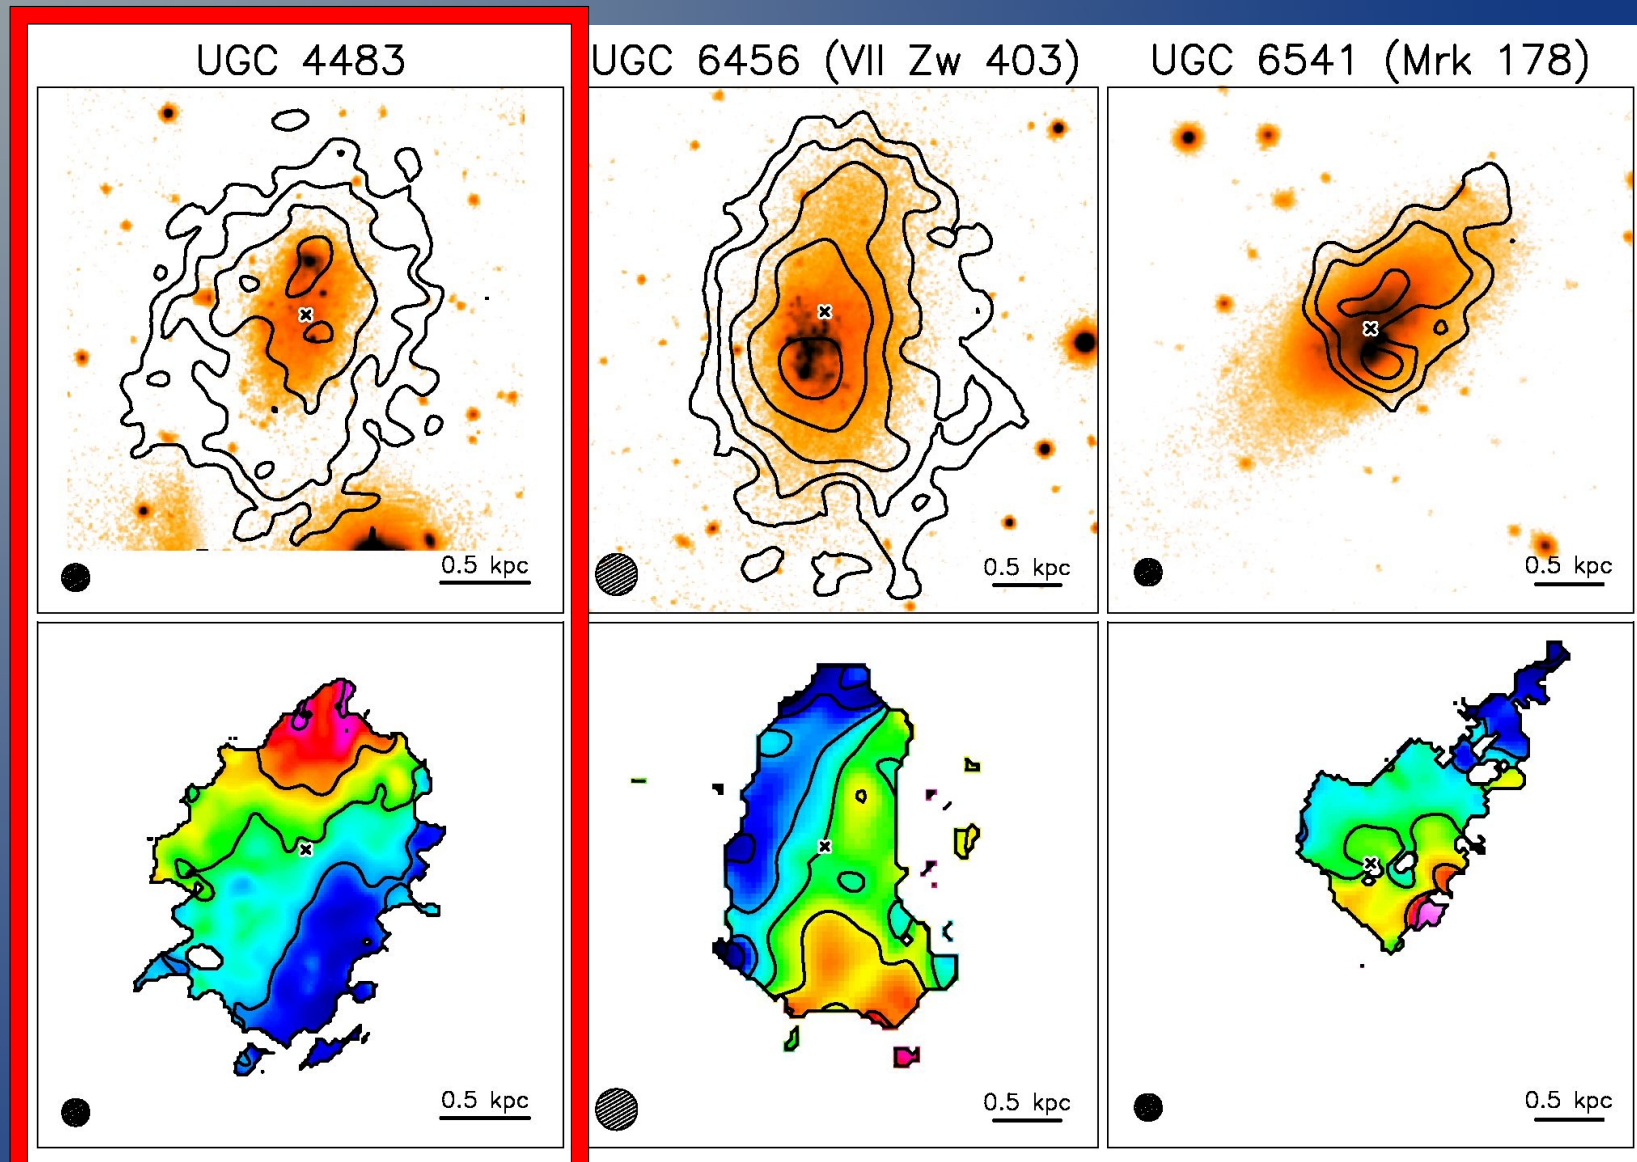

H α kinematics show no outflowing gas.

McLeod, Lelli & Beccari (in prep.)

Questions:

- What triggers the starburst?
(External vs Internal mechanisms)
- What is the effect of stellar feedback?
(Gas outflows? Shocks?)
- What are the progenitors/descendants?
(Evolutionary links with Irrs and Sphs?)

HI Kinematics of Starburst Dwarfs

~50%
rotating HI disk

~40%
kin. disturbed HI disk

~10%
unsettled HI distr.

Starburst vs Irregular

HI map

UGC 4483

$\sim 10 M_{\odot}/\text{pc}^2$

DDO 125

$\sim 3 M_{\odot}/\text{pc}^2$

Swaters et al. (2002, 2009)

Optical

1 kpc

$$M_{\text{dyn}} \sim 1-2 \times 10^8 M_{\odot}$$

Lelli et al. (2012a, 2012b)

Inner Circular-Velocity Gradient

$$\lim_{R \rightarrow 0} \frac{dV_{\text{circ}}(R)}{dR} \propto \sqrt{\rho_0}$$

ρ_0 = central dynamical mass density

For a **bulgeless disk galaxy**:

$$dV/dR \sim V(R_d)/R_d$$

R_d = disk scale length

- Measure the **inner shape** of the potential well
- Equal to the **angular speed** along the solid-body part

$$V(R_d)/R_d \propto \sqrt{\rho_0}$$

Starbursts vs Irrs

Link: Star Formation – inner potential well

Lelli, Fraternali & Verheijen 2014
(Irrs from Swaters et al. 2009)

$V(R_d)/R_d \propto \sqrt{\rho_0}$ "Compact" Irregulars

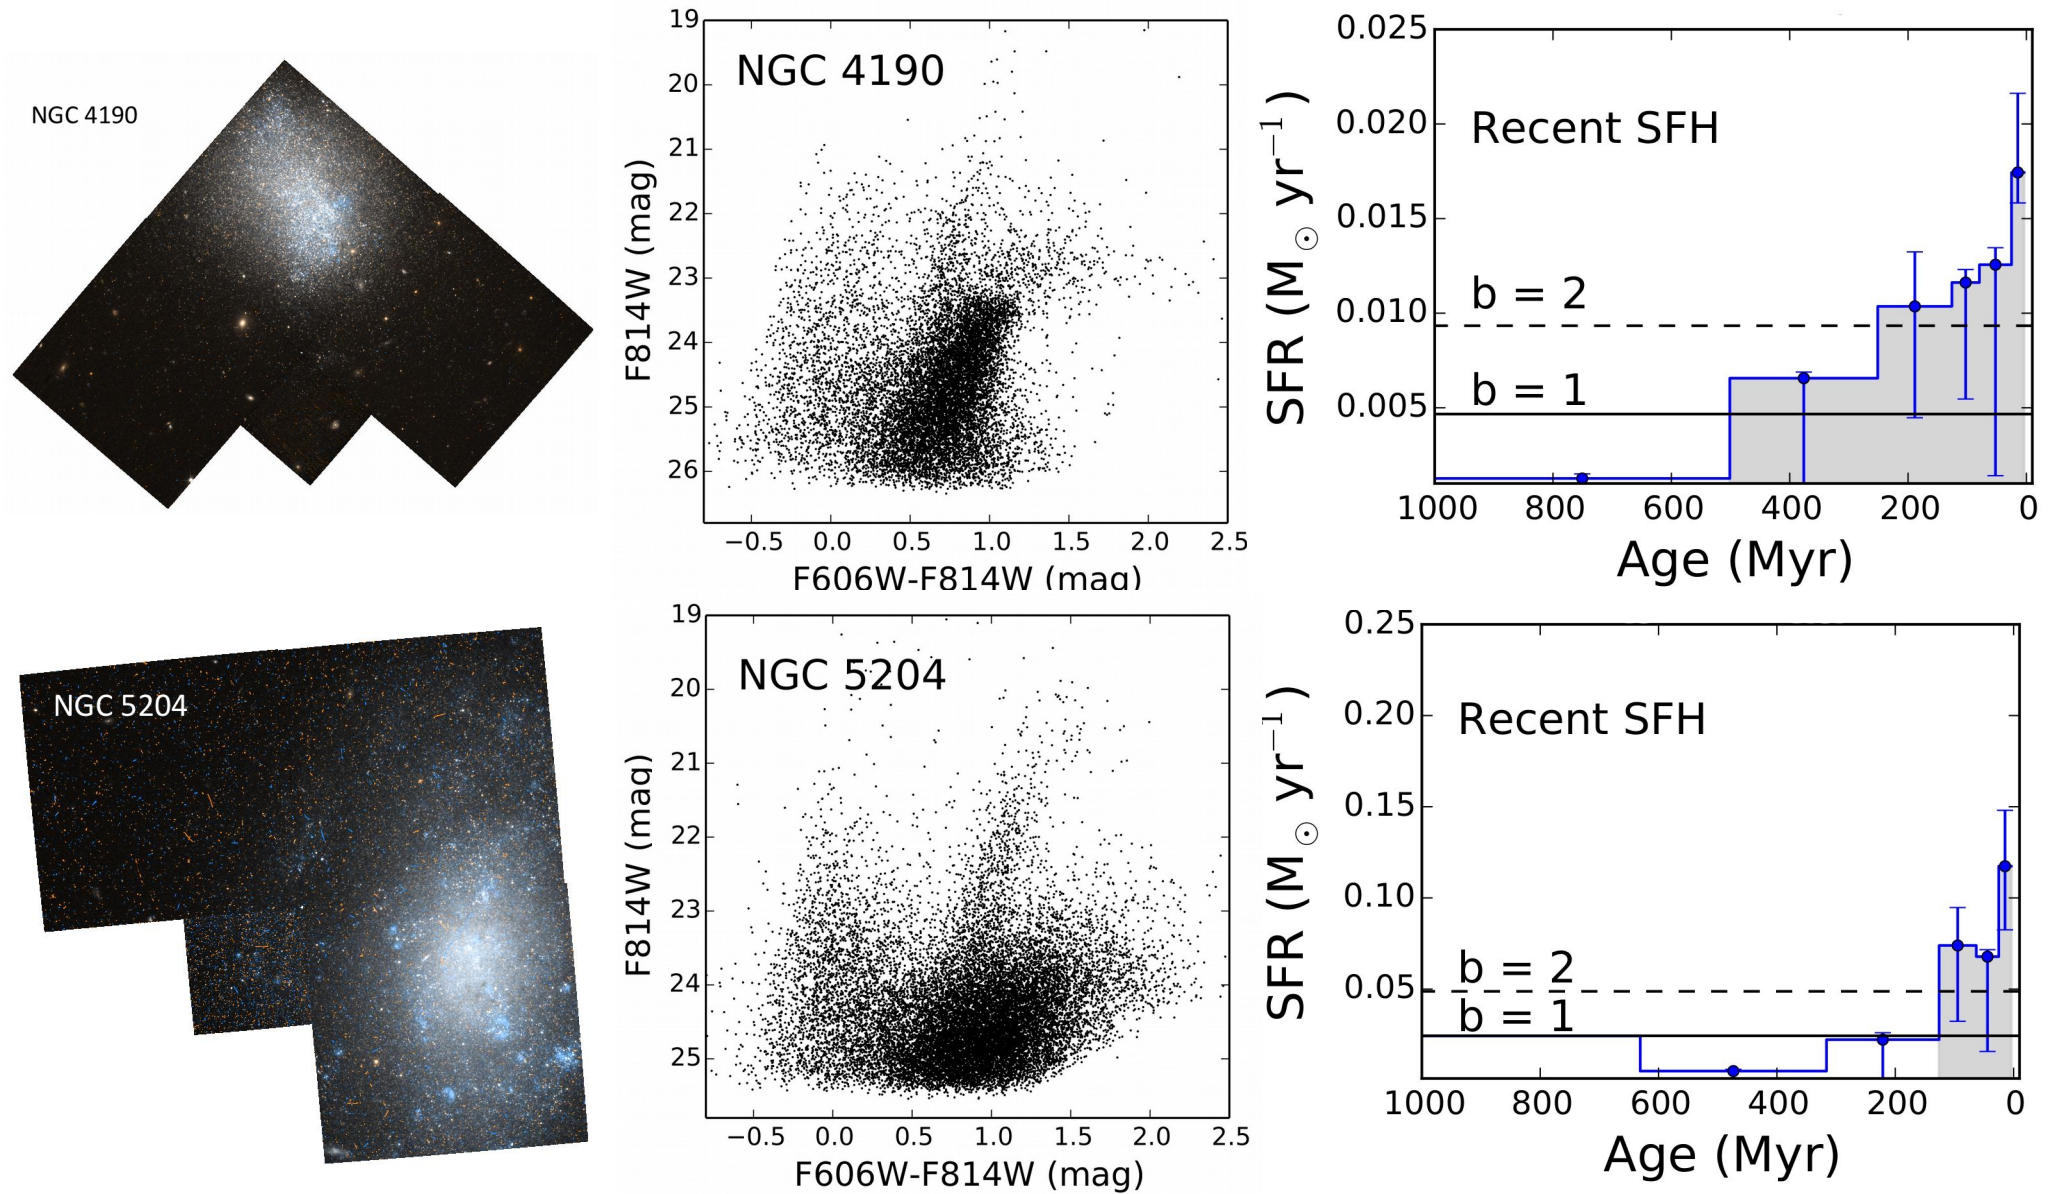

Link: Star Formation – inner potential well

Lelli, Fraternali & Verheijen 2014

Compact Irrs = similar ρ_0 as starbursts

(Irrs from Swaters et al. 2009)

SF histories of "compact" Irrs

Some compact Irrs may be misidentified starbursts! McQuinn, Lelli, Skillman et al. 2015

Rotating dE/Sph in the Virgo Cluster

Optical Spectroscopy:

Geha et al. (2002, 2003)

van Zee et al. (2004)

interactions?

Starbursts (~5%?)

Quenching: environment?

Lelli et al. (2014a), A&A

Summary on Starburst Dwarfs

- Starbursts are triggered by external mechanisms
Interactions/mergers or cold gas accretion
- No evidence for massive gas outflows
Stellar feedback may play a role but on local scales
- Starbursts have high central mass concentrations
Star Formation <--> Inner Gravitational Potential
Starburst Dwarfs <--> Compact Irr or Rotating dE/Sph

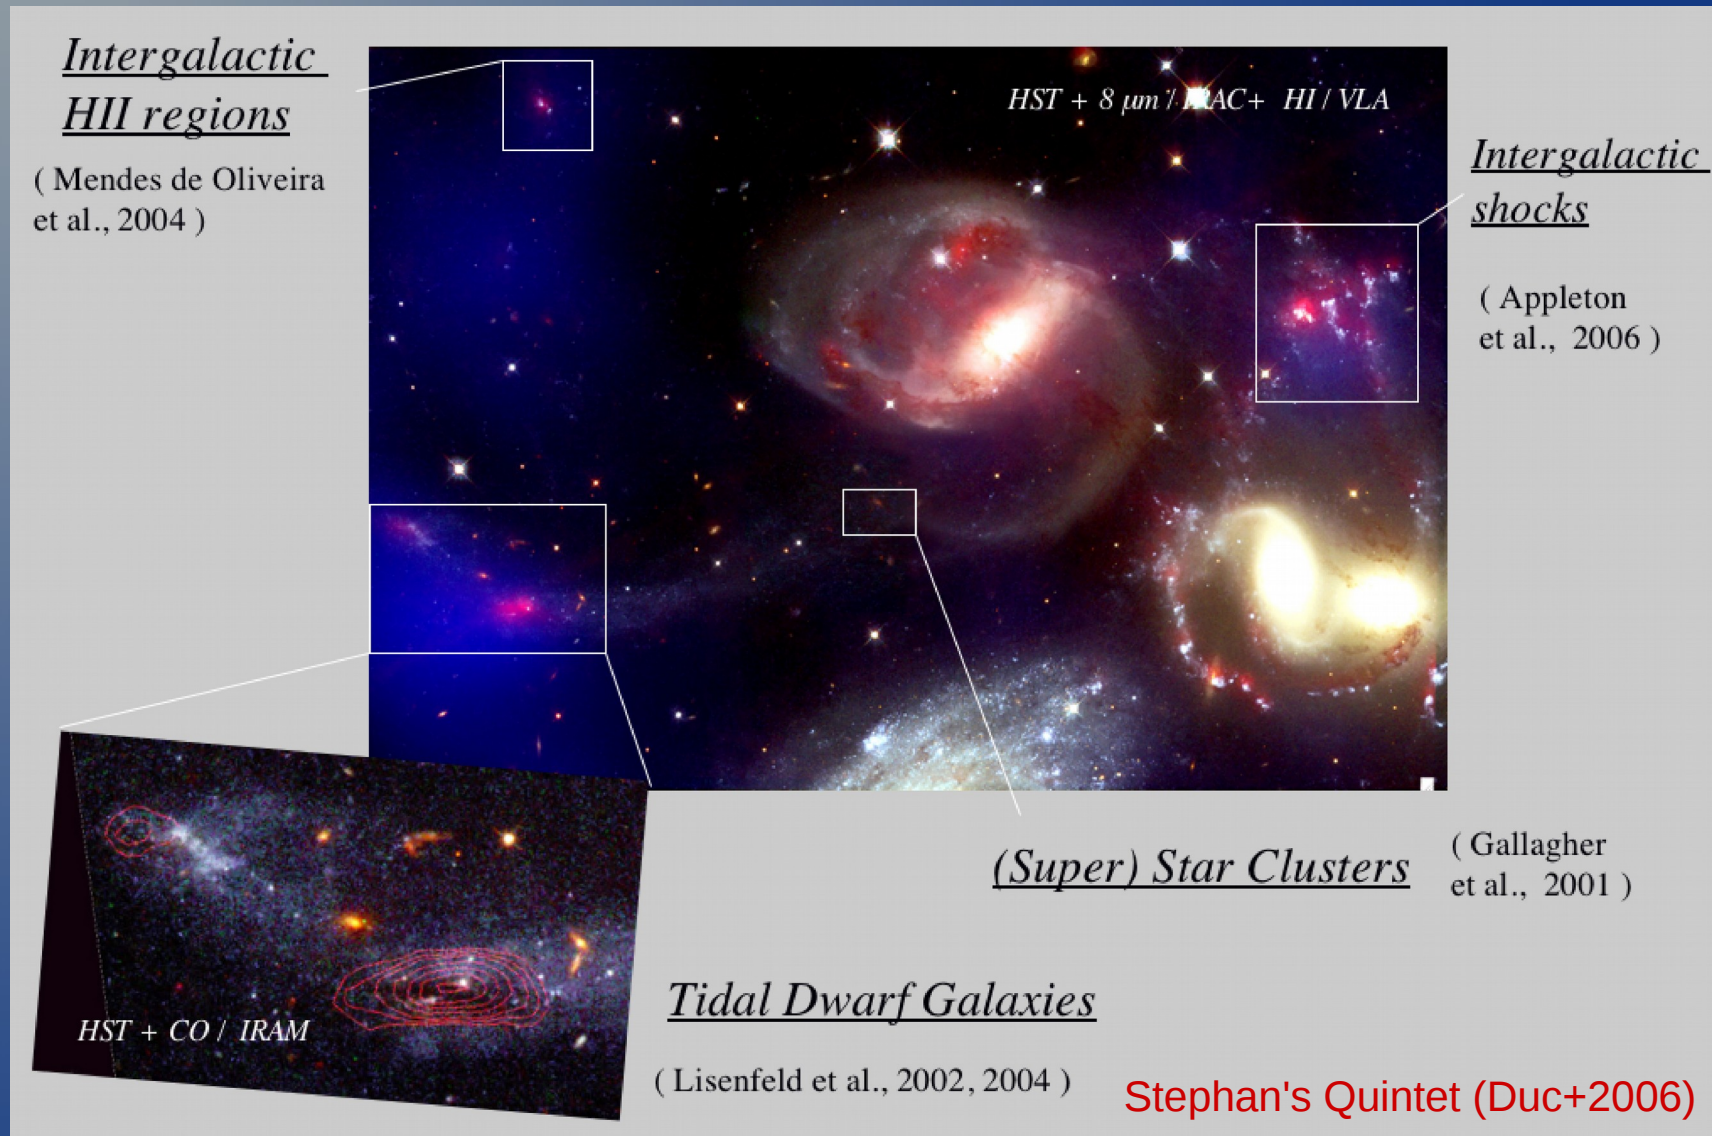

Tidal Dwarf Galaxies

In collaboration with:

Pierre-Alain Duc, Stacy McGaugh, Elias Brinks, Frédéric Bournaud,
Ute Lisenfeld, Médéric Boquien, Peter Weilbacher, Jonathan Braine,
Yves Revaz, Baerbel Koribalski, Pierre-Emmanuel Belles

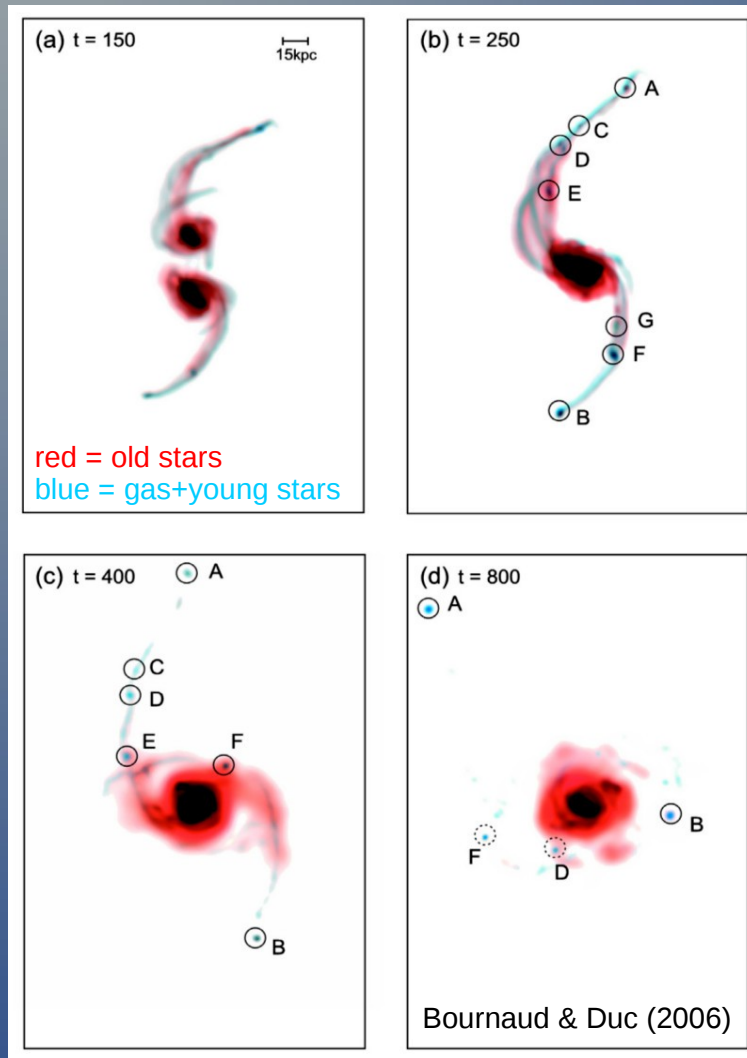

What is a Tidal Dwarf Galaxy (TDG)?

Different types of objects are formed during interactions/mergers:

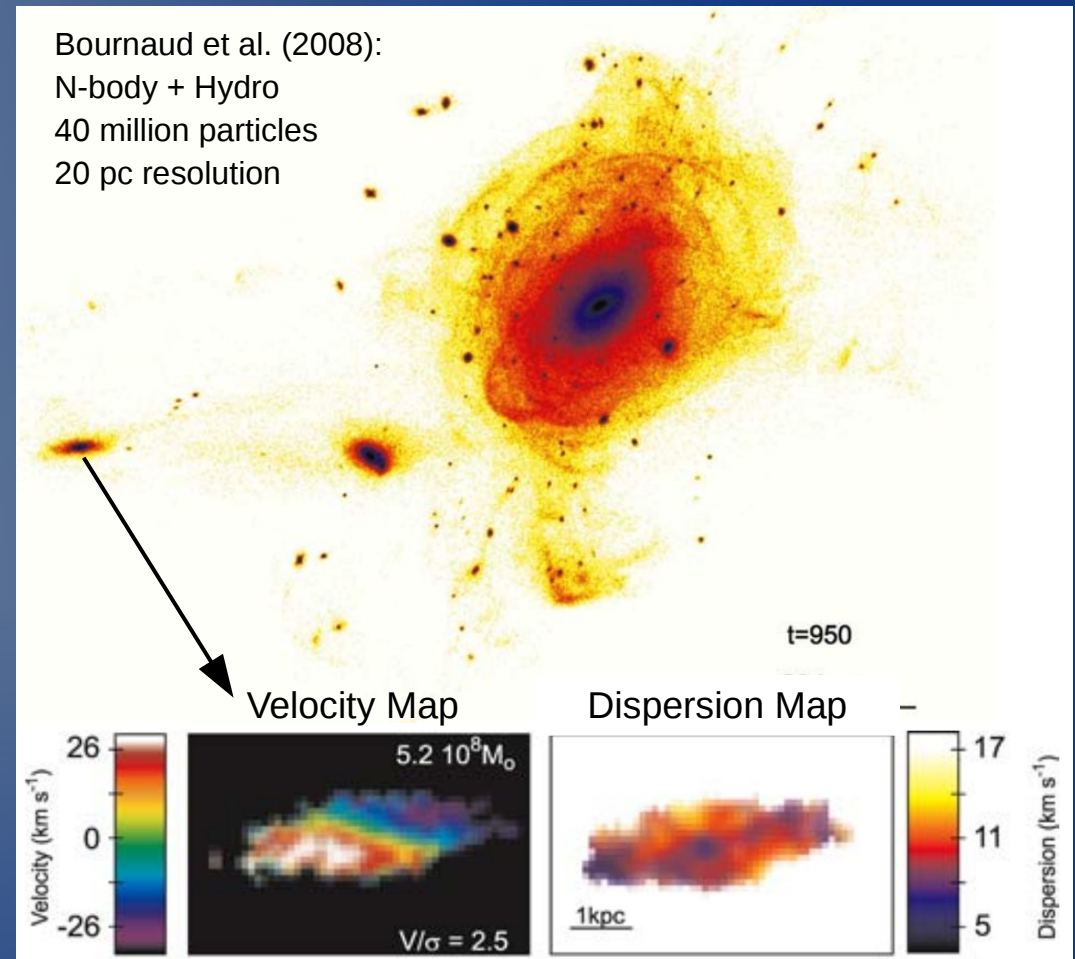

TDG candidates = Massive condensations of gas & young stars ($\sim 10^8$ - $10^9 M_{\text{sun}}$)

TDGs from numerical simulations

Most massive TDGs can survive:
How many dwarfs have tidal origin?
(Bournaud & Duc 2006; Ploekinger+2014, 2015)

Simulated TDGs are rotation supported
and devoid of non-baryonic dark matter!
(Barnes & Hernquist 1992; Elmegreen+1993; Duc+2004;
Bournaud & Duc 2006; Wetzstein+2007; Bournaud+2008)

Prediction: TDGs should be free of DM!

- Tides have different effects on the **dynamically-cold disc** w.r.t. the **dynamically-hot DM halo** (e.g. Barnes & Hernquist 1992):
 - Disc --> tails, bridges, and eventually TDGs
 - Halo --> too dynamically-hot to form tails

Prediction: TDGs should be free of DM!

- Tides have different effects on the **dynamically-cold disc** w.r.t. the **dynamically-hot DM halo** (e.g. Barnes & Hernquist 1992):
 - Disc --> tails, bridges, and eventually TDGs
 - Halo --> too dynamically-hot to form tails
- Baryons & DM are "segregated" in phase-space

Prediction: TDGs should be free of DM!

- Tides have different effects on the **dynamically-cold disc** w.r.t. the **dynamically-hot DM halo** (e.g. Barnes & Hernquist 1992):
 - Disc --> tails, bridges, and eventually TDGs
 - Halo --> too dynamically-hot to form tails
- Baryons & DM are "segregated" in phase-space
- TDGs have **shallow potential wells** with $V_{\text{rot}} < 50 \text{ km/s}$:
They cannot accrete DM particles with $\sigma_v \sim 200 \text{ km/s}$!

Previous kinematic studies on TDGs

Braine+2001: No evidence of DM!

Bournaud+2007: Evidence of DM!

Rotation velocities from CO line-widths (TDGs unresolved)

Rotation velocities from HI interferometry (TDGs barely resolved)

Missing mass in TDGs?
CO-dark molecules?

Sample of 6 bona-fide TDGs

Blue = HI (VLA)
Pink = FUV (GALEX)

Yellow = Tidal Dwarf Galaxies

Lelli, Duc, Brinks et al. 2015, A&A

Requirements to be a bona-fide TDG

1) High metallicities

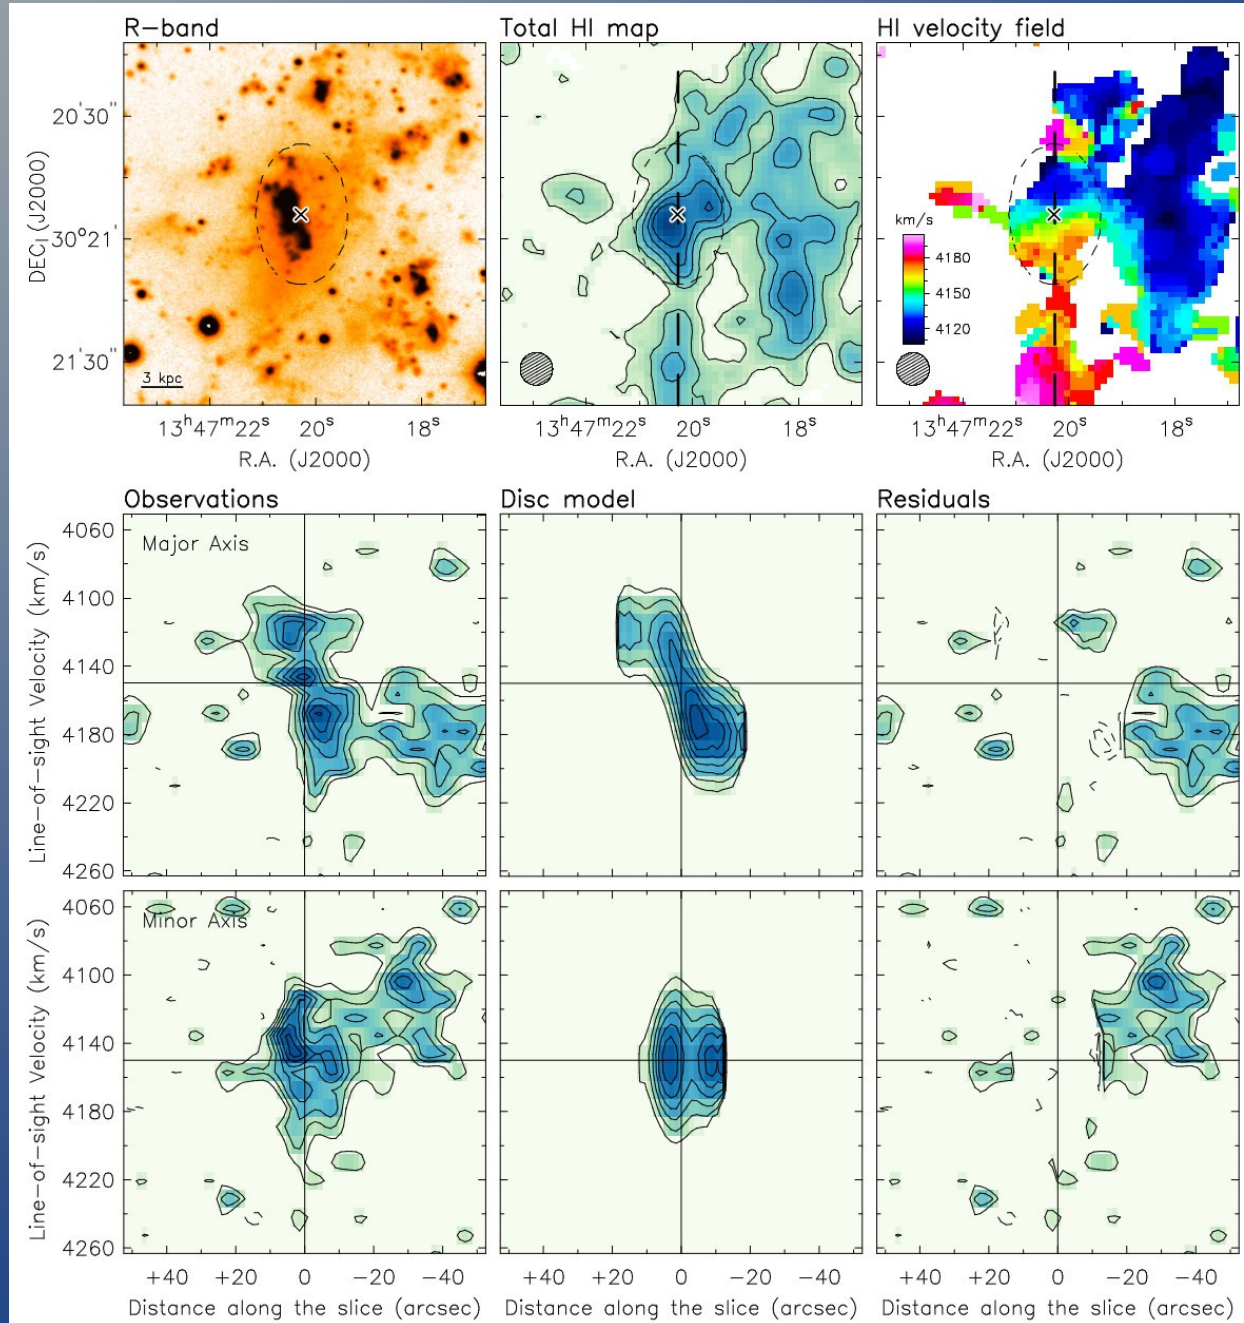

Young TDGs are forming out of **pre-enriched material** ejected from massive progenitors!

2) Kinematically distinct components

TDGs are associated with **steep HI velocity gradients**: rotation in a local potential well? Gravitationally bound?

Rotating disk models for TDGs

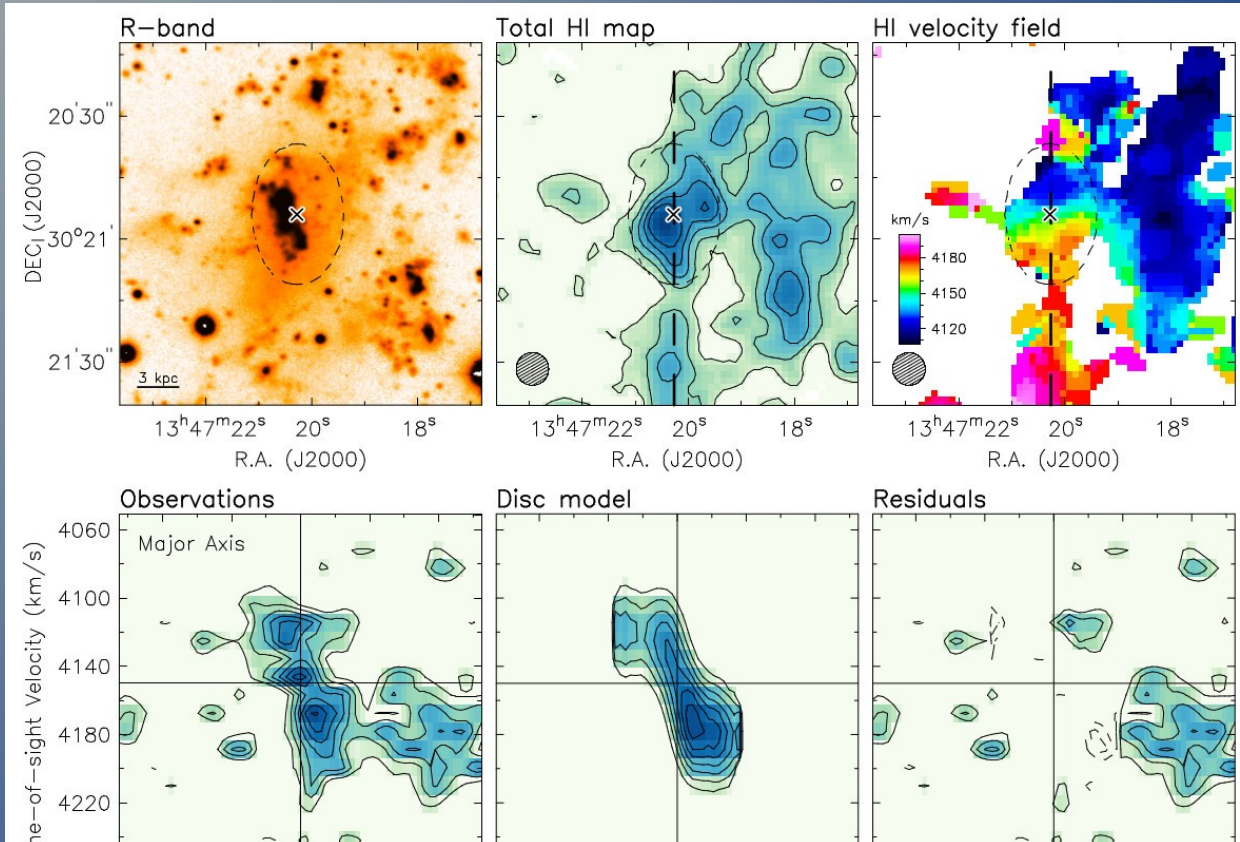

Lelli et al. (2015), A&A:

- High-Res. VLA data
- 3D kinematical model

Rotating disk models for TDGs

Lelli et al. (2015), A&A:

- High-Res. VLA data
- 3D kinematical model

Puzzling Issue: $t_{\text{orb}} > t_{\text{merg}}$ (or TDG "age")

The disk didn't have time to make one orbit!

Are TDGs in dynamical equilibrium?

IF TDGs are in dynamical equilibrium...

No Dark Matter! (as expected from simulations)

Deviation from the baryonic TF relation!

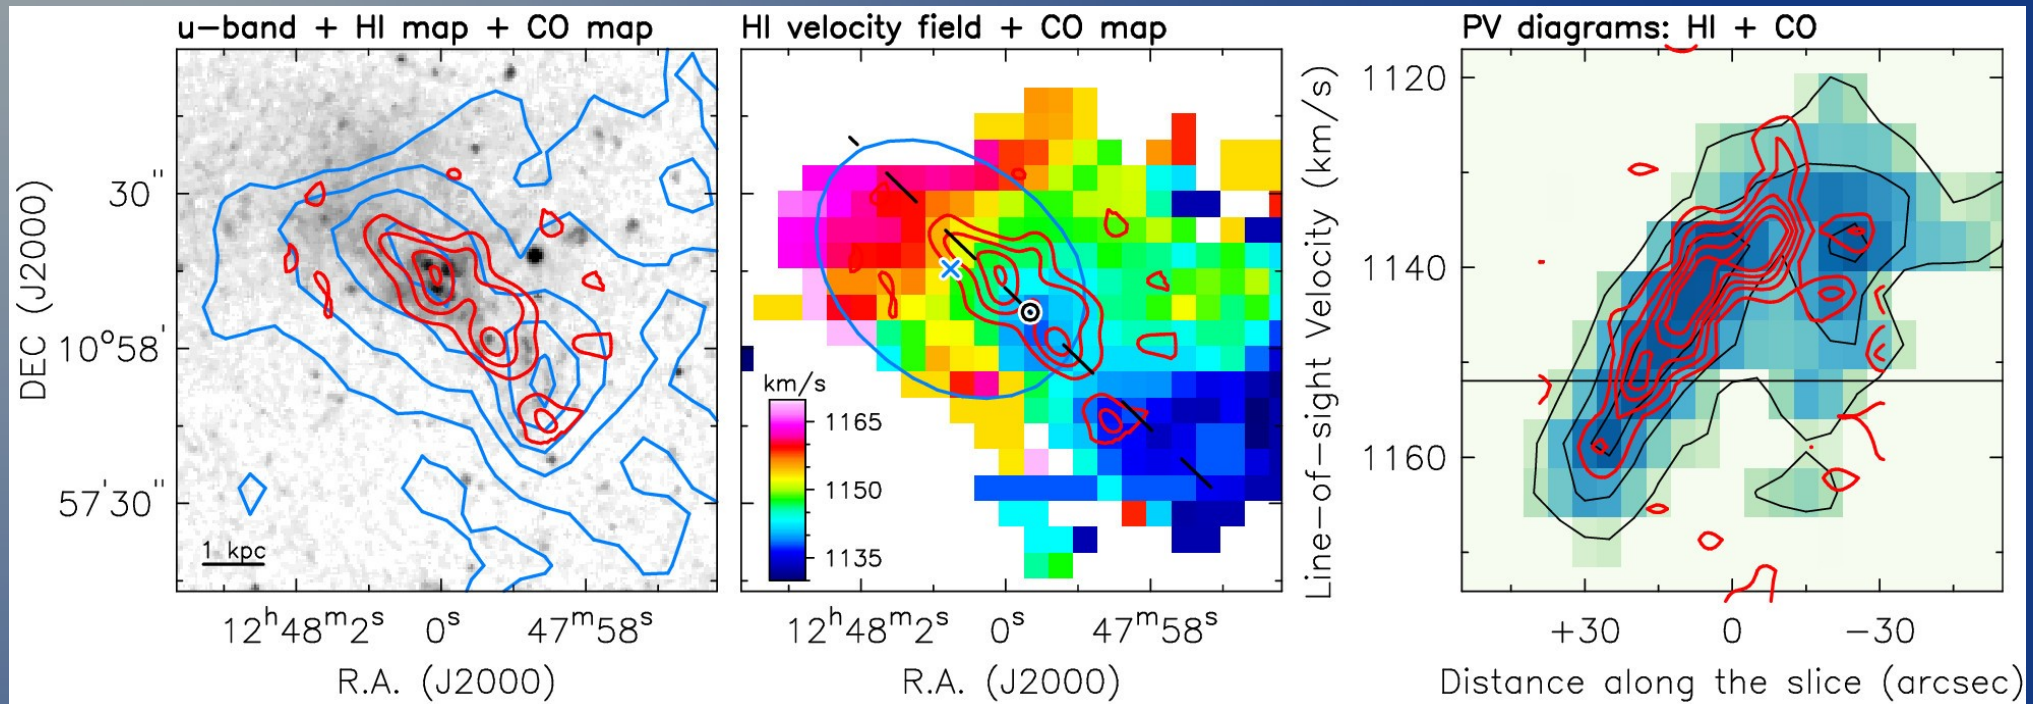

$M_{\text{dyn}}/M_{\text{bar}} \sim 1$! The high values reported by Bournaud et al. (2007) are not confirmed.

Caution: the shape of the rotation curve is uncertain. We may not be tracing V_{flat}

CO(1-0) in VCC 2062 from IRAM PdBI

HI (blue) + CO (red)

Lisenfeld et al. 2016, A&A

- CO covers only a fraction of the HI disk
- CO and HI kinematics are consistent
- CO forms locally within the tidal HI debris

Star-Formation Laws in VCC 2062

Total Gas Density (HI + H₂)

Gas Density + Free-fall time

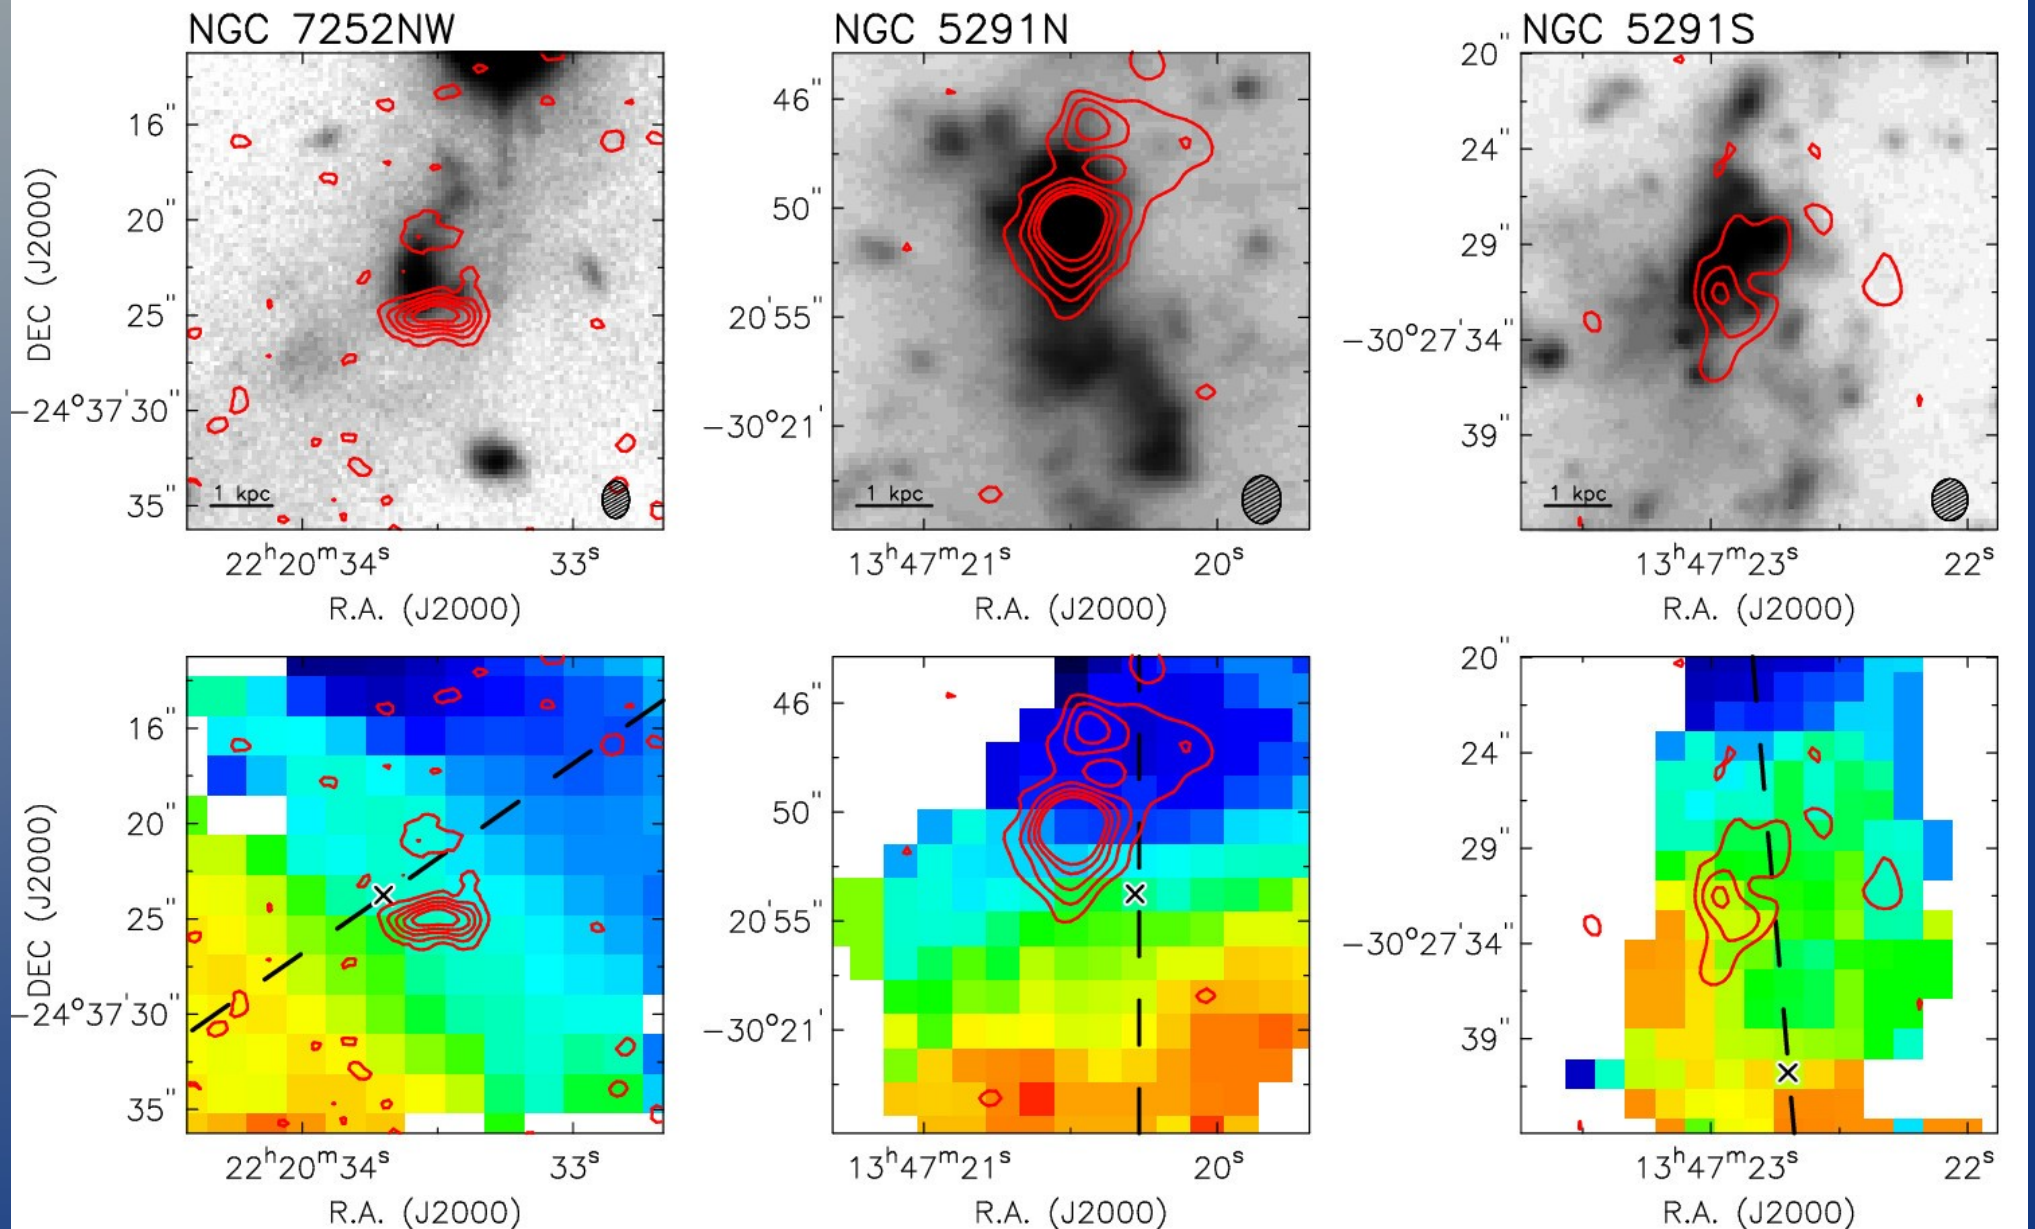

Gas Density + Orbital time

Star-Formation Efficiency in VCC 2062 lower than in normal galaxies:

- Low stellar surface density (low vertical force)?
- Intermittent star-formation (short temporal variations)?
- Long orbital times (low DM fraction)?

CO(1-0) in TDGs from ALMA

Lelli et al. in preparation

Summary on Tidal Dwarf Galaxies

- TDGs are clumps of HI, molecules, and young stars:
Masses, sizes, and SFRs similar to dwarf galaxies
- TDGs are associated with rotating HI disks:
No evidence for DM but dynamical equilibrium is an issue!
- Molecular gas seems less efficient in forming stars:
Reasons unclear. New ALMA data under analysis!

Derivation of the Rotation Curve

2D fit to the Velocity Field

Rotation curve (+ center, V_{sys} , PA, incl.)

$$V_{\text{rot}} \sim 20 \text{ km/s}$$

$$V_{\text{rad}} \sim 5 \text{ km/s}$$

$$\sigma_{\text{HI}} \sim 8 \text{ km/s}$$

$$V_{\text{rot}}/\sigma_{\text{HI}} \sim 2-3$$

Correction for pressure-support

3D disk model ↔ Observations

Mass Model Example: UGC 4483

Lelli et al. 2012, A&A, 544, 145L

$$M_{\text{dyn}} = (16 \pm 3) \times 10^7 M_{\odot}$$

$$M_{*(\text{HST})} = (1.0 \pm 0.3) \times 10^7 M_{\odot}$$

Assuming Salpeter IMF
(McQuinn+2010)

$$M_{\text{gas}} = (3.3 \pm 0.4) \times 10^7 M_{\odot}$$

$$M_{*(\text{young})} \sim 0.2 \times 10^7 M_{\odot}$$

$$M(\text{molecules}) \sim ?$$

At least $\sim 30\%$ of the mass within R_{opt} is baryonic (gas + old stars)

Molecular mass is unknown...

Dwarfs are metal-poor

CO lines undetected

CO-to-H₂ conversion
may depend on Z!

Indirect estimate:

$M_{\text{mol}} (M_{\odot}) \sim 2 \times 10^9 \text{ SFR } (M_{\odot}/\text{yr})$

(e.g. Leroy+2008)

Link: Dynamics - Star Formation

$$V(R_d)/R_d \propto \Sigma_{\text{Toomre}}$$

$$\Sigma_{\text{SFR}} = \text{SFR}_{\text{H}\alpha} / (\pi R_{\text{opt}}^2)$$

H α fluxes from Kennicutt+2008

$$T_{\text{dep}} = \Sigma_{\text{SFR}} / \Sigma_{\text{gas}}$$

Optical Structure of BCDs

Papaderos et al. (1996)

Optical Structure of BCDs

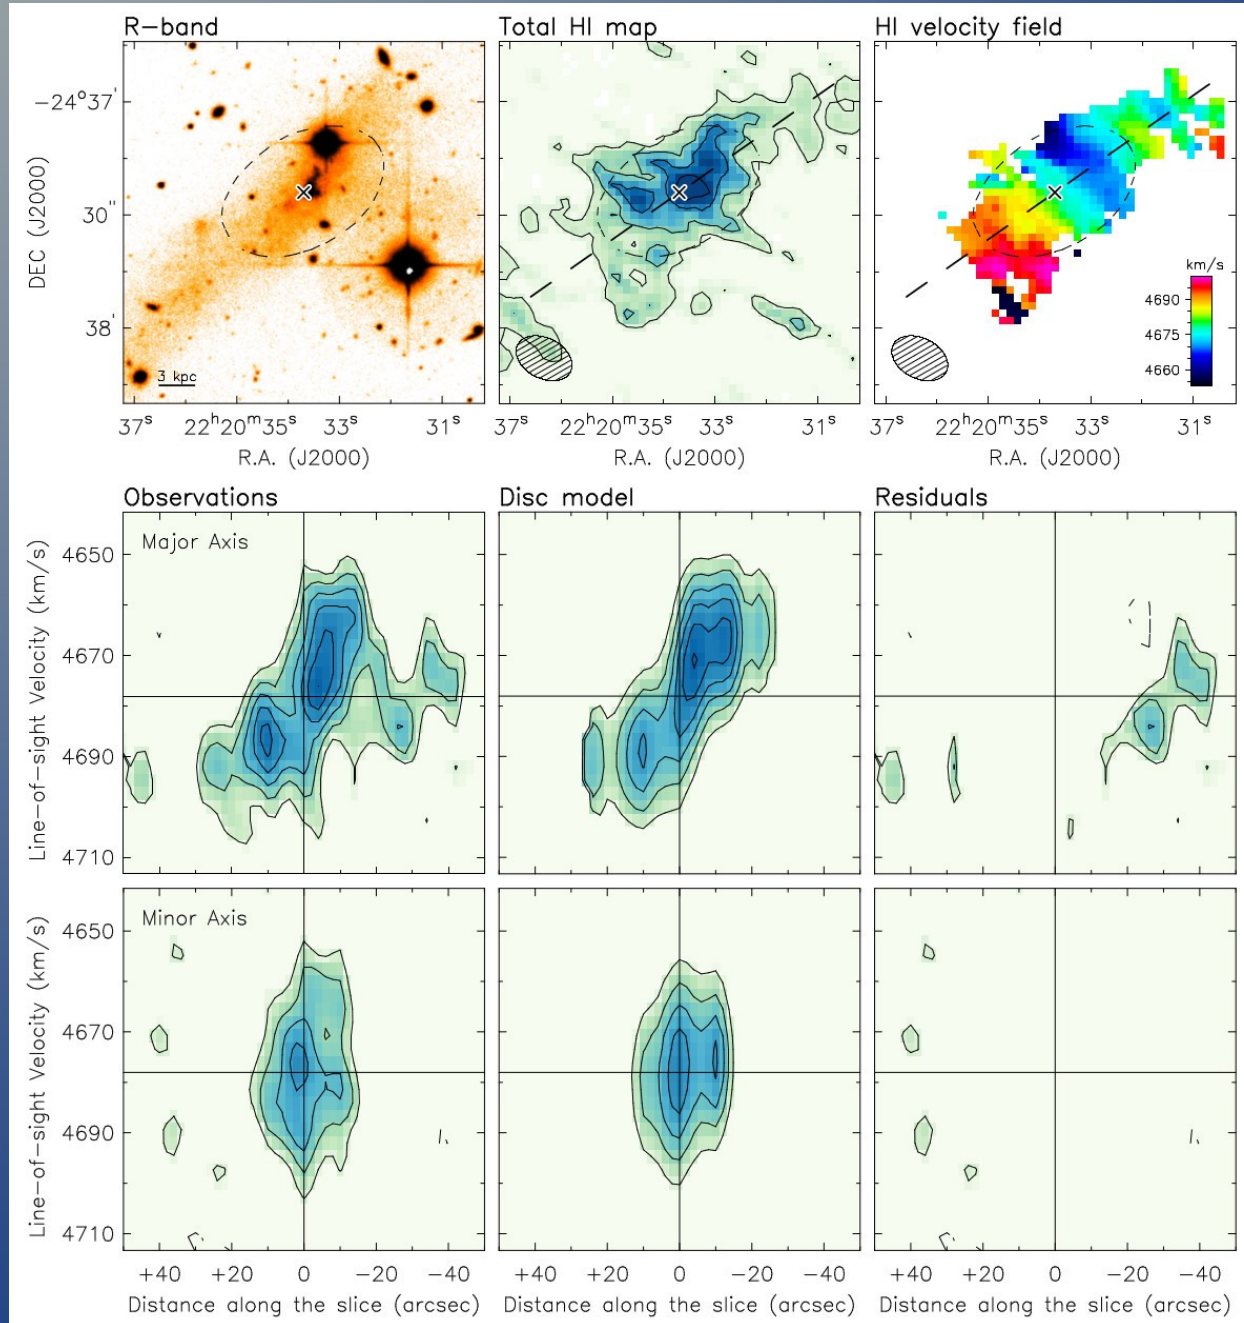

Old component of BCDs: $\mu_0 \sim 21.5 \text{ mag asec}^{-2}$ (Freeman value)

Papaderos et al. (1996, 2002); Salzer & Norton (1999); Cairos et al. (2001);

Gil de Paz & Madore (2005); Amorin et al. (2009).

Rotating disk models for TDGs

Lelli et al. (2015), A&A:

- High-Res. VLA data
- 3D kinematical model

$$V_{\text{rot}} \sim 20 \text{ km/s}$$

$$R_{\text{HI}} \sim 8 \text{ kpc}$$

$$M_{\text{gas}}/M_{*} \sim 8!!$$

Old TDGs around Ellipticals

Optical + HI (WSRT)

Deep g-band image after subtraction of NGC 5557

Starburst Dwarfs ~ High-z Galaxies?

- **Clumpy morphologies** (e.g. Elmegreen+2009)
- **High gas fractions:** $M_{\text{gas}}/M_* > 1$ (e.g. Salzer+2002)
- **Low metallicities:** $Z < 0.3 Z_{\odot}$ (e.g. Izotov & Thuan 1999)

Irrs are DM dominated (using typical M_*/L)

UGC 5414 (NGC 3104)

Maximum Disk: $M_*/L_R = 4.6$

$M_*/L_R = 7.1 \pm 1.5$ $i=55$ $q=1$

UGC 9211 (DDO 189)

Maximum Disk: $M_*/L_R = 11.2$

$M_*/L_R = 16.2 \pm 1.1$ $i=44$ $q=1$

Swaters et al. (2011, 2012)
